# Object Detection

---

Region proposals  
(Optional)

# Region proposal: R-CNN = Regions w/ CNN

↓  
No point running CNN here, nothing of Interest here  
- RCNN - tries to pick regions in which you should run your CNN classifier so that you efficiently use compute that you need

- Segmentation Algo  
- Finds blobs on which you can run your CNN  
- Blobs are shown in black  
If we run CNN there, hopefully we find objects of Interest  
Bounding Box

# Faster algorithms

R-CNN:

(slow)

Propose regions. Classify proposed regions one at a time. Output label + bounding box.

Fast R-CNN:

(clustering step of  
proposing regions  
is still slow)

Propose regions. Use convolution implementation of sliding windows to classify all the proposed regions.

Faster R-CNN: Use convolutional network to propose regions.
