# Object Detection

---

## Anchor boxes

# Overlapping objects:

$$y = \begin{bmatrix} p_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{bmatrix} \quad \left. \vphantom{\begin{bmatrix} p_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{bmatrix}} \right\} \text{pedestrian, car, motorcycle}$$

Anchor box 1:

Anchor box 2:

$$y = \left[ \begin{array}{l} p_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{array} \right] \left. \vphantom{\begin{bmatrix} p_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{bmatrix}} \right\} \text{Anchor box 1}$$

$$\left[ \begin{array}{l} p_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{array} \right] \left. \vphantom{\begin{bmatrix} p_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{bmatrix}} \right\} \text{Anchor box 2}$$

# Anchor box algorithm

Previously:

Each object in training image is assigned to grid cell that contains that object's midpoint.

∴ y dim is  $3 \times 3 \times 8$   
grid 8 elements in y  
( $P_c, b_x, b_y, b_H, b_W, c_1, c_2, c_3$ )

With two anchor boxes:

Each object in training image is assigned to grid cell that contains object's midpoint and anchor box for the grid cell with highest IoU.

- Highest IoU will be of Anchor Box 1 wrt ground truth
- There can be more than 2 Anchor Boxes

# Anchor box example

→ Helps specialized output  
tall skinny → for person  
flat, long → car

## Drawbacks

- ① If we had say 3 objects in a grid cell & only 2 Anchor boxes? This wouldn't work
- ② What if Both Anchor boxes were horizontal shaped? You would need to design your Algo such that the bigger IOU Anchor box is chosen

$y =$

$p_c$

Anchor Box 1

Anchor Box 2

Anchor box 1:

Anchor box 2:

How to choose Anchor Box shape?

- ① By hand
- ② Kmeans - find shapes that fit your dataset well.

→ pedestrian

→ car
